Reading the Anggraini, Binariswanto and Legowo (2019) piece straight after the TOGAF chapters in Jager was actually a good way to see the framework applied rather than just explained in the abstract. The paper looks at a government agency that wanted to move toward cloud computing but had no real structured way of getting there, since cloud adoption interest was high but there was no standardised framework tying that ambition back to actual business strategy. That gap is what pushed the authors to combine ROCCA with TOGAF 9.2 rather than relying on either one alone.

What I found useful is how the two frameworks end up doing different jobs. ROCCA is essentially a readiness roadmap built around five stages, analysis, design, adoption, migration and management, so it is quite good at figuring out whether an organisation is actually ready to move to the cloud and what shape that move should take. TOGAF, on the other hand, brings the structured architecture development method and governance side that ROCCA does not really have on its own. When the authors mapped ROCCA's processes against the TOGAF ADM phases, most of it clustered around the earlier phases, essentially the analysis and planning stages that feed into selecting and preparing a cloud solution. That tells me ROCCA is strong for getting an agency to the starting line but does not carry the same weight once you get into the later TOGAF phases like migration planning, implementation governance or architecture change management, which matches what Jager (2025, Chapters 3 and 4) describes as the ADM being iterative and governance heavy well beyond the initial vision stage.

For a government agency specifically, that combination makes sense to me. Public sector IT decisions tend to need more accountability and structured justification than a private company might, so pairing a lightweight readiness model like ROCCA with something as rigorous as TOGAF gives the agency both the practical cloud specific guidance and the enterprise architecture credibility to justify the decision internally. I would be curious whether this same pairing holds up as well in a larger or more decentralised government structure, since this study seems to be a fairly contained single agency case.
